Kansas Risk Factor Definition
Presence of a thyroid disorder diagnosed by a physician as self-reported by client; or as reported or documented by a physician, or someone working under physician’s orders. The medical conditions include, but are not limited to, the following:

- Hyperthyroidism – Excessive thyroid hormone production (most commonly known as Graves’ disease and toxic multinodular goiter).
- Hypothyroidism – Low secretion levels of thyroid hormone (can be overt or mild/subclinical). Most commonly seen as chronic autoimmune thyroiditis (Hashimoto’s thyroiditis or autoimmune thyroid disease). It can also be caused by severe iodine deficiency.

USDA Justification
Note: USDA Justification is provided because it explains nicely why the risk is important. However, you must use the Kansas risk factor names and definitions which may differ slightly from the USDA document.
