

MISSOURI RIVER BASIN TOTAL MAXIMUM DAILY LOAD

Water Body: Troy Fair Lake

Water Quality Impairment: Eutrophication bundled with Aquatic Plants

1. INTRODUCTION AND PROBLEM IDENTIFICATION

Subbasin: Tarkio-Wolf **County:** Doniphan
HUC 8: 10240005 **HUC 11 (HUC 14): 070 (050)**
Drainage Area: Approximately 0.15 square mile
Conservation Pool: Area = 4.2 acres, Mean Depth = 1.7 meters
Designated Uses: Secondary Contact Recreation; Expected Aquatic Life Support; Food Procurement
1998 303d Listing: Table 4 - Water Quality Limited Lakes
Impaired Use: All uses are impaired to a degree by eutrophication

Water Quality Standard: Nutrients - Narrative: The introduction of plant nutrients into streams, lakes, or wetlands from artificial sources shall be controlled to prevent the accelerated succession or replacement of aquatic biota or the production of undesirable quantities or kinds of aquatic life. (KAR 28-16-28e(c)(2)(B)).

The introduction of plant nutrients into surface waters designated for primary or secondary contact recreational use shall be controlled to prevent the development of objectionable concentrations of algae or algal by-products or nuisance growths of submersed, floating, or emergent aquatic vegetation. (KAR 28-16-28e(c)(7)(A)).

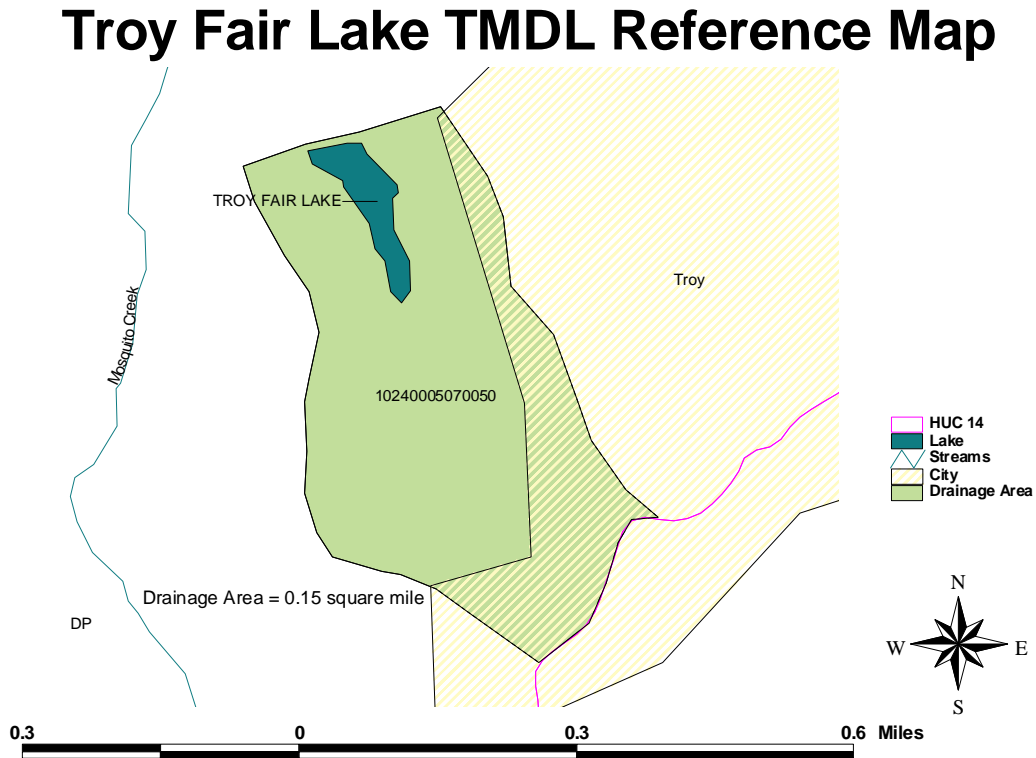

2. CURRENT WATER QUALITY CONDITION AND DESIRED ENDPOINT

Level of Eutrophication: Hypereutrophic, Trophic State Index = 65.18

Monitoring Sites: Station 073801 in Troy Fair Lake (Figure 1)

Period of Record Used: One survey in 1994.

Figure 1

Current Condition: The average chlorophyll a concentration was 34.1 ppb in 1994. The average, total phosphorus concentration was 25 ppb over the period of record. This total phosphorus data is suspect. Based on this data, the chlorophyll a to total phosphorus yield appears extremely high. According to the CNET model, the total phosphorus concentration should be closer to 63 ppb. The aquatic plants cover approximately 50% of the lake. Nuisance growth of aquatic plants (for recreation use) is defined as greater than 70% cover. Based on this criterion, Troy Fair Lake should not have been listed for an Aquatic Plant impairment.

The Trophic State Index is derived from the chlorophyll a concentration. Trophic state assessments of potential algal productivity were made based on chlorophyll a concentrations, nutrient levels, and values of the Carlson Trophic State Index (TSI). Generally, some degree of eutrophic conditions is seen with chlorophyll a concentrations over 7 ug/l and hypereutrophy occurs at levels over 30 ug/L. The Carlson TSI, derives from the chlorophyll concentrations and scales the trophic state as follows:

- | | |
|-----------------------|-----------------|
| 1. Oligotrophic | TSI < 40 |
| 2. Mesotrophic | TSI: 40 - 49.99 |
| 3. Slightly Eutrophic | TSI: 50 - 54.99 |
| 4. Fully Eutrophic | TSI: 55 - 59.99 |
| 5. Very Eutrophic | TSI: 60 - 63.99 |
| 6. Hypereutrophic | TSI: ≥ 64 |

Interim Endpoints of Water Quality (Implied Load Capacity) at Troy Fair Lake over 2005 - 2009:

In order to improve the trophic condition of the lake from its current hypereutrophic status, the desired endpoint will be summer chlorophyll a concentrations at or below 20 ug/l, corresponding to a trophic state of eutrophic conditions by 2009. Achievement of this endpoint should also result in a 30 - 40% cover of aquatic plants. Refined endpoints will be developed in 2005 to reflect additional sampling and artificial source assessment and confirmation of impaired status of the lake.

3. SOURCE INVENTORY AND ASSESSMENT

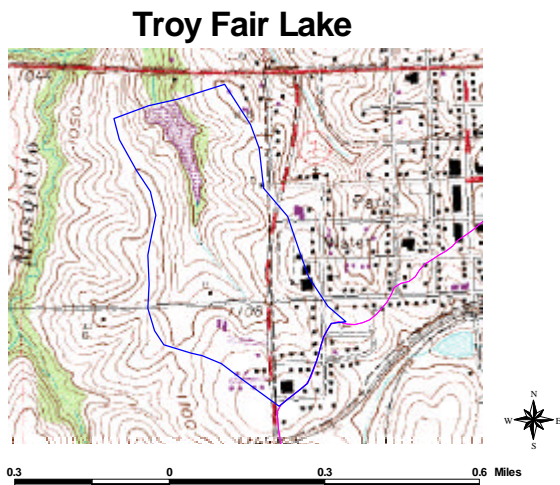

Land Use: The watershed has a moderate potential for nonpoint source pollution. An annual phosphorus load of 72.7 pounds per year is necessary to correspond to the concentrations seen in the lake.

One source of phosphorus within the lake is runoff from agricultural lands where phosphorus has been applied. Land use coverage analysis indicates that 34.9% of the watershed is cropland. In 1999, the total amount of fertilizer sold in Doniphan County was 18,066 tons. Assuming that the drainage area of Troy Fair Lake covers 0.04% of the county, then 6.8 tons of fertilizer were bought and potentially used with the watershed.

Phosphorus from animal waste is a contributing factor. Twenty-eight percent of land around the lake is grassland; the grazing density of livestock is moderate.

Fertilizer applications to lawns within the drainage and stormwater delivery to the lake are possible loading sources (Figure 2). The watershed is 30.3% residential. The population of Troy is projected to increase 1.5% to the year 2020. The population density in the watershed is low (16.53 people/square mile).

Figure 2

Background Levels: Small amounts of phosphorus are contributed from precipitation and watershed soils.

4. ALLOCATION OF POLLUTANT REDUCTION RESPONSIBILITY

Phosphorus is the limiting nutrient in Troy Fair Lake and allocated under this TMDL. More detailed assessment of sources and confirmation of the trophic state of the lake must be completed before detailed allocations can be made. The general inventory of sources within the drainage does provide some guidance as to areas of load reduction.

Point Sources: A current Wasteload Allocation of zero is established by this TMDL because of the lack of point sources in the watershed. Should future point sources be proposed in the watershed and discharge into the impaired segments, the current wasteload allocation will be revised by adjusting current load allocations to account for the presence and impact of these new point source dischargers.

Nonpoint Sources: Water quality violations are partially due to nonpoint source pollutants. Background levels may be attributed to precipitation and geology. The assessment suggests that urban and agricultural runoff in the watershed contributes to the hypereutrophic state of the lake. Generally a Load Allocation of 37.5 pounds of total phosphorus per year, leading to a 42.4% reduction, is necessary to reach the endpoint.

Defined Margin of Safety: The margin of safety provides some hedge against the uncertainty of variable annual total phosphorus loads and the chlorophyll a and aquatic plant endpoints. Therefore, the margin of safety will be 4.2 pounds of total phosphorus per year taken from the load capacity subtracted to compensate for the lack of knowledge about the relationship between the allocated loadings and the resulting water quality.

State Water Plan Implementation Priority: Because a more detailed source assessment and additional in-lake monitoring of nutrient and algal content is needed, this TMDL will be a Low Priority for implementation.

Unified Watershed Assessment Priority Ranking: This watershed lies within the Tarkio-Wolf (HUC 8: 10240005) with a priority ranking of 13 (High Priority for restoration).

Priority HUC 11s: The lake is within HUC 11 (070).

5. IMPLEMENTATION

Desired Implementation Activities

There is some opportunity to reduce nonpoint source nutrient loads to Troy Fair Lake. Attention should be given to both the urban and agricultural Best Management Practices. Some of the recommended agricultural practices are as follows:

1. Implement soil sampling to recommend appropriate fertilizer applications on cropland.

2. Maintain conservation tillage and contour farming to minimize cropland erosion.
3. Install grass buffer strips along streams.
4. Reduce activities within riparian areas.
5. Implement nutrient management plans to manage manure application to land.

Implementation Programs Guidance

Until the 2006 assessment of the continuation of monitoring is made, no direction can be made to those implementation programs.

Time Frame for Implementation: Continued monitoring over the years from 2001 to 2005.

Targeted Participants: Primary participants for implementation will be agricultural producers within the drainage of the lake. A detailed assessment of sources will be conducted by KDHE over 2002-2005.

Milestone for 2006: The year 2006 marks the midpoint of the ten-year implementation window for the watershed. At that point in time, sampled data from Troy Fair Lake will be reexamined to confirm the impaired status of the lake. Should the case of impairment remain, source assessment, allocation and implementation activities will ensue.

Delivery Agents: Depending upon confirmation of impairment and assessment of probable sources, the primary delivery agents for program participation will be the City of Troy, conservation districts for programs of the State Conservation Commission, and the Natural Resources Conservation Service.

Reasonable Assurances:

Authorities: The following authorities may be used to direct activities in the watershed to reduce pollutants.

1. K.S.A. 65-171d empowers the Secretary of KDHE to prevent water pollution and to protect the beneficial uses of the waters of the state through required treatment of sewage and established water quality standards and to require permits by persons having a potential to discharge pollutants into the waters of the state.
2. K.S.A. 2-1915 empowers the State Conservation Commission to develop programs to assist the protection, conservation and management of soil and water resources in the state, including riparian areas.
3. K.S.A. 75-5657 empowers the State Conservation Commission to provide financial assistance for local project work plans developed to control nonpoint source pollution.
4. K.S.A. 82a-901, et seq. empowers the Kansas Water Office to develop a state water plan directing the protection and maintenance of surface water quality for the waters of

the state.

5. K.S.A. 82a-951 creates the State Water Plan Fund to finance the implementation of the Kansas Water Plan.

6. The Kansas Water Plan and the Missouri Basin Plan provide the guidance to state agencies to coordinate programs intent on protecting water quality and to target those programs to geographic areas of the state for high priority in implementation.

Funding: The State Water Plan Fund annually generates \$16-18 million and is the primary funding mechanism for implementing water quality protection and pollutant reduction activities in the state through the *Kansas Water Plan*. The state water planning process, overseen by the Kansas Water Office, coordinates and directs programs and funding toward watersheds and water resources of highest priority. Typically, the state allocates at least 50% of the fund to programs supporting water quality protection. This watershed and its TMDL are a Low Priority consideration and should not receive funding until after 2006.

Effectiveness: Effectiveness of corrective actions will depend upon the sources which contribute to the impairment at the lake.

6. MONITORING

Additional data, to establish nutrient ratios, source loading and further determine mean summer trophic condition of the lake, would be of value prior to 2005. Further sampling and evaluation should occur twice before 2005.

7. FEEDBACK

Public Meeting: A public meeting to discuss TMDLs in the Missouri Basin was held February 28, 2001 in Atchison. An active Internet Web site was established at <http://www.kdhe.state.ks.us/tmdl/> to convey information to the public on the general establishment of TMDLs and specific TMDLs for the Missouri Basin.

Public Hearing: A Public Hearing on the TMDLs of the Missouri Basin was held in Hiawatha on May 29, 2001.

Basin Advisory Committee: The Missouri Basin Advisory Committee met to discuss the TMDLs in the basin on October 4, 2000, February 28 and May 29, 2001.

Milestone Evaluation: In 2006, evaluation will be made as to the degree of implementation which has occurred within the watershed and current condition of Troy Fair Lake. Subsequent decisions will be made regarding the implementation approach and follow up of additional implementation in the watershed.

Consideration for 303d Delisting: Troy Fair Lake will be evaluated for delisting under Section 303(d), based on the monitoring data over the period 2005-2009. Therefore, the decision for delisting will come about in the preparation of the 2010 303(d) list. Should modifications be made to the applicable nutrient criterion during the ten-year implementation period, consideration for delisting, desired endpoints of this TMDL and implementation activities may be adjusted accordingly.

Incorporation into Continuing Planning Process, Water Quality Management Plan and the Kansas Water Planning Process: Under the current version of the Continuing Planning Process, the next anticipated revision will come in 2002 which will emphasize revision of the Water Quality Management Plan. At that time, incorporation of this TMDL will be made into both documents. Recommendations of this TMDL will be considered in *Kansas Water Plan* implementation decisions under the State Water Planning Process after Fiscal Year 2002-2006.
