Pregnant and recently pregnant people (for at least 42 days following end of pregnancy) with COVID-19 are at increased risk for:

- Preeclampsia
- Coagulopathy
- Preterm Birth
- Stillbirth
- Severe illness that requires hospitalization, ICU admission, intubation
- Death

As of September 2021, more than 125,000 laboratory-confirmed COVID-19 cases have been reported in pregnant people, including more than 22,000 hospitalized cases and 161 deaths. Data from the COVID-19-Associated Hospitalization Surveillance Network (COVID-NET) in 2021 indicate that approximately 97% of pregnant people with a confirmed SARS-CoV-2 infection that were hospitalized (either for illness or for labor and delivery) were unvaccinated.

Information also suggests that pregnant people with comorbidities such as obesity have a higher risk for severe illness than the general population with similar comorbidities. Additionally, studies are finding that other factors, such as race, ethnicity, age (older than 25 years) and occupation, can further increase a pregnant person’s risk for developing severe illness.

Data were collected from 134,687 women, but race/ethnicity was only available for 117,521 (87.3%) women.

Source: [CDC COVID Data Tracker, 2021](#)
The CDC recommends COVID-19 vaccination for people who are pregnant, recently pregnant (including those who are lactating), who are trying to get pregnant now, or who might become pregnant in the future.

CDC recommendations align with those from professional medical organizations serving people who are pregnant, including the American College of Obstetricians and Gynecologists (ACOG) and the Society for Maternal-Fetal Medicine. Accumulating data provide evidence of both the safety and effectiveness of COVID-19 vaccination in pregnancy. CDC strongly recommends COVID-19 vaccination either before or during pregnancy, because the benefits of vaccination for both pregnant persons and their fetus/infant outweigh known or potential risks. Getting a COVID-19 vaccine can prevent severe illness, death, and pregnancy complications related to COVID-19.1

Healthcare Provider Recommendations:
A strong recommendation from a healthcare provider is a critical factor in COVID-19 vaccine acceptance and can make a meaningful difference to protect the health of pregnant, and recently pregnant people, and their fetuses/infants from COVID-19.

- Communicate the risks of COVID-19, the benefits of vaccination, and information on the safety and effectiveness of COVID-19 vaccination in pregnancy.
- Strongly recommend that people who are pregnant, recently pregnant (including those who are lactating), who are trying to become pregnant now, or who might become pregnant in the future receive one of the authorized or approved COVID-19 vaccines as soon as possible.
- Ensure all clinical staff are aware of the guidance and recommendations.
- Review patients’ COVID-19 vaccination status at each pre- and post-natal visit and discuss COVID-19 vaccination with those who are unvaccinated.
- Remind patients that vaccination is recommended even for those with prior COVID-19 infections. Studies have shown that vaccination provides increased protection in people who have recovered from COVID-19.
- Communicate accurate information about COVID-19 vaccines and confront misinformation with evidence-based messaging from credible sources. For example, there is currently no evidence that any vaccines, including COVID-19 vaccines, cause fertility problems in women or men.
- Become a COVID-19 vaccine provider and vaccinate patients during their visit. More information can be found at How to Enroll as a COVID-19 Vaccination Provider.

Social Media Messages

The Kansas Department of Health and Environment (KDHE) created these graphics and sample posts in order to help you engage and educate your communities about COVID-19 and pregnancy. Posts can be customized to include your organization-specific information.

1. Pregnant or trying to conceive? COVID-19 vaccines are safe, effective & offer the best protection against COVID-19 for you & your baby. There is no evidence these or other vaccines cause fertility problems in women or men. Talk to your doctor or learn more: https://www.cdc.gov/coronavirus/2019-ncov/vaccines/recommendations/pregnancy.html.

2. Are you pregnant, recently pregnant – including those who are breastfeeding – or trying to become pregnant? The benefits of COVID-19 vaccination outweigh known or potential risks. Do not delay. Get a COVID-19 vaccine today. Find yours at vaccines.gov.

3. 2 in 3 pregnant women remain unvaccinated & unprotected against severe illness, pregnancy complications & death from COVID-19. Protect yourself & your baby from COVID-19. Talk to your doctor or visit vaccines.gov.

4. Pregnant people with COVID-19 are also at increased risk for: severe illness, preterm birth, preeclampsia, excessive bleeding or clotting and stillbirth. COVID-19 vaccines are safe, effective & offer the best protection for you & your baby. Find your vaccine provider today: vaccines.gov.

6. If you are pregnant or are trying to conceive, make sure you are receiving prenatal care, including a COVID-19 vaccine. If you feel like you are having any symptoms of COVID-19, seek care as soon as possible.
