Prenatal Infection Prevention Month is a worldwide observance to promote awareness of infections transmitted from mother to baby. Prenatal infections are fungal, parasitic, bacterial or viral illnesses that can be passed from a mother to her baby during pregnancy or during the delivery process. According to research, up to 24% of stillbirths in developed countries, like the U.S., result from infection. Many more babies are born with disabilities, such as hearing loss or birth defects, because of these infections. The good news is that in many cases, prenatal infections can be prevented, and Prenatal Infection Prevention Month places a spotlight on this issue.

What Can Providers Do?
Reducing preventable maternal and newborn morbidity and mortality requires a collaborative effort among healthcare providers at every level.

**Emphasize**
- routine prenatal screening to evaluate maternal immunity and increase early diagnosis and treatment of prenatal infections.

**Educate**
- and make a strong recommendation that women receive the appropriate adult immunizations before conception and the recommended vaccines during pregnancy. Evidence shows that strong provider recommendations improve immunization acceptance.

**Utilize**
- immunization information systems to document vaccinations and use data to inform maternal and child health strategies and program planning.

**Share**
- resources and educate women that prenatal infections can be prevented with healthy pregnancy habits such as practicing good hygiene, receiving prenatal care and immunizations, good nutrition, and taking environmental precautions to avoid dangerous infections.

Prenatal Infection Patient Resources

**Virus**
- COVID-19 Vaccines While Pregnant or Breastfeeding (cdc.gov)
- Zika
- Influenza (Flu)
- Chickenpox
- Measles/Rubella
- Cytomegalovirus (CMV)
- Pertussis

**Patient talking points to reduce the risk of infections:**
- Get vaccinated against viruses that cause the flu, chickenpox, measles, rubella, pertussis and COVID-19. Talk to your provider about getting vaccinated.
- Wash hands often with soap and water for at least 20 seconds. If soap and water are not available, use hand sanitizer that contains at least 60 percent alcohol.
- Stay away from people who are sick (if possible), and wear a face mask if exposed to people with serious infections like COVID-19.⁴

**STI**
- Syphilis
- Group B Strep
- Chlamydia
- Gonorrhea
- Hepatitis B/Hepatitis C
- HIV

**Patient talking points to reduce the risk of STIs:**
- Get tested. Find out if you have an STI and get treated right away.
- Don’t have sex. This is the best way to prevent getting an STI.
- If you have sex, have sex with only one person who doesn’t have other sex partners. Use a condom if you’re not sure if your partner has an STI. Ask your partner to get tested and treated for STIs.
- Attend all prenatal appointments⁴

**Other**
- Bacterial Vaginosis
- Food Poisoning (listeria or listeriosis)
- Toxoplasmosis
- Periodontal Disease (infected gums)

**Patient talking points to reduce the risk of infections from food:**
- Cook meat, poultry (chicken, turkey), fish, shellfish and eggs until they’re done. Don’t eat them if they’re undercooked or raw. Heat deli meat and hot dogs before eating.
- Wash all your food before you cook or eat it. Wash all cooking utensils, dishes and your hands after touching raw meat, chicken or fish.⁴

**Patient talking points to reduce the risk of other infections:**
- Brush and floss your teeth every day. Get regular dental care during pregnancy. Make sure your dentist knows you’re pregnant before getting an X-ray.
- Don’t change a cat’s litter box. Ask someone else to do it.
- Don’t touch soil that may have cat poop in it. Wear gloves when you work in the garden.⁴
