November is World Prematurity Month

Rates of premature births are continuing to climb in the United States, with 1 in 10 babies being born before 37 weeks gestation.\(^1\)

While births before 34 weeks gestation have remained relatively steady in recent years, the rates of babies born between 34-37 weeks has continued to rise across White, Black, and Hispanic populations.\(^8\)

While Kansas falls slightly below the national average for prematurity at 9.5%, large disparities exist with Black mothers experiencing premature deliveries 45% more often than those of other races.\(^3\) Factors such as inadequate health care coverage, poverty, chronic disease and smoking, as well as inadequate prenatal education are identified as being contributing factors for premature births. To learn more about contributing factors and reducing disparities in preterm birth, please see November’s Did You Know and the Preterm Births in Kansas Infographic.

Prevalence of Preterm Birth, Among Kansas Women with a Recent Live Birth

Data were gathered from the Kansas Pregnancy Risk Assessment Monitoring System (PRAMS), 2017-2018. Kansas PRAMS is a survey in which women who have recently given birth are interviewed about their health and experiences before, during, and shortly after pregnancy.

**By Race/Ethnicity\(^*\)**

<table>
<thead>
<tr>
<th>Race/Ethnicity</th>
<th>Prevalence</th>
</tr>
</thead>
<tbody>
<tr>
<td>Non-Hispanic White</td>
<td>7.6%</td>
</tr>
<tr>
<td>Non-Hispanic Black</td>
<td>14.9%</td>
</tr>
<tr>
<td>Hispanic</td>
<td>5.4%</td>
</tr>
<tr>
<td>Non-Hispanic Other/Multiracial*</td>
<td>7.2%</td>
</tr>
</tbody>
</table>

A higher proportion of non-Hispanic Black mothers gave birth to a preterm infant, compared to non-Hispanic White mothers, non-Hispanic mothers of other race, and Hispanic mothers.

\(^*\) Includes Asian, Native American, Native Hawaiian/Pacific Islander, other race, and multiracial.

**By Self-Reported Health Insurance Status During Pregnancy\(^**\)**

<table>
<thead>
<tr>
<th>Insurance</th>
<th>Prevalence</th>
</tr>
</thead>
<tbody>
<tr>
<td>Private</td>
<td>6.6%</td>
</tr>
<tr>
<td>Medicaid</td>
<td>11.0%</td>
</tr>
<tr>
<td>No insurance</td>
<td>5.6%</td>
</tr>
</tbody>
</table>

The estimated prevalence of preterm birth was higher among women who reported Medicaid as their primary health insurance during pregnancy, compared to women who had private health insurance or were uninsured.

**By Self-Reported Smoking Status in the Last 3 Months of Pregnancy\(^**\)**

<table>
<thead>
<tr>
<th>Smoking Status</th>
<th>Prevalence</th>
</tr>
</thead>
<tbody>
<tr>
<td>Did not smoke</td>
<td>7.3%</td>
</tr>
<tr>
<td>Smoked</td>
<td>12.3%</td>
</tr>
</tbody>
</table>

The estimated prevalence of preterm birth was higher among women who reported smoking in the last 3 months of pregnancy, compared to those who did not smoke in the last 3 months of pregnancy.

By Self-Reported Health Conditions in the 3 Months Before Pregnancy**

<table>
<thead>
<tr>
<th>Condition</th>
<th>Yes</th>
<th>No</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hypertension</td>
<td>16.2%</td>
<td>7.3%</td>
</tr>
<tr>
<td>Anxiety</td>
<td>11.7%</td>
<td>6.5%</td>
</tr>
</tbody>
</table>

By Self Reported Health Conditions During Pregnancy***

<table>
<thead>
<tr>
<th>Condition</th>
<th>Yes</th>
<th>No</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gestational diabetes*</td>
<td>12.9%</td>
<td>7.4%</td>
</tr>
<tr>
<td>Pregnancy-onset hypertension, pre-eclampsia, or eclampsia</td>
<td>20.0%</td>
<td>6.2%</td>
</tr>
<tr>
<td>Depression</td>
<td>11.1%</td>
<td>7.1%</td>
</tr>
<tr>
<td>Anxiety</td>
<td>10.0%</td>
<td>6.8%</td>
</tr>
</tbody>
</table>

Certain self-reported health conditions before pregnancy (anxiety and hypertension) and during pregnancy (gestational diabetes; pregnancy-onset hypertension, pre-eclampsia, or eclampsia; anxiety; and depression) were associated with an increased prevalence of preterm birth, respectively. There was not enough evidence to show that diabetes or depression experienced during the 3 months before pregnancy were associated with preterm birth.

* Gestational diabetes was considered as answering “yes” to having gestational diabetes, and “no” to having diabetes in the 3 months before pregnancy.

Impact of Prematurity

Preterm birth does not only have negative effects on families, but also on our communities and our nation as a whole. Unfortunately, data on the cost of preterm birth to society is not routinely collected.

In one of the most comprehensive studies to date, a 2007 Institute of Medicine (IOM) review estimated that the societal economic burden associated with prematurity in the US was at least $26.2 billion annually in 2005 dollars, or $51,600 per infant born preterm. Premature babies are more likely to stay in the hospital longer, need more medical care, may develop learning and behavior problems, may have trouble in school, and have a higher risk of needing early intervention and special education services.iii

Our Role as Health Educators

As health care providers and health educators, we know the importance of quality education and accessible health care and resources for the families we serve. Providing Kansas families with affordable, comprehensive, and accessible opportunities for prenatal care and education is paramount to battling rising prematurity rates. Information provided by resources such as the Healthy Babies Are Worth the Wait campaign, aimed at educating about the importance of the last few weeks of pregnancy, can help families make healthier choices for their unborn child.iv Additionally, encouraging women to receive frequent, quality appointments with their providers and to follow through with tobacco cessation programs can make the difference between a preterm and full-term delivery.vi Please utilize the below resources and join us as we observe World Prematurity Month throughout the month of November and World Prematurity Day on November 17!

1. Disparities in Kansas
In Kansas, Black mothers are 1 ½ times more likely to have a preterm birth than women of other races. Accessibility to healthcare and prenatal education can help lower these rates to keep Black mothers and babies healthy!
To learn more about contributing factors and reducing disparities in preterm birth, please see “Did You Know” and “Preterm Births In Kansas”.

2. Easy Steps for a Healthy Pregnancy
While there are many things during pregnancy that you can’t control, there are things you can do to give your baby the best start at life. These not only promote healthy development for your baby and reduce your chances of having a premature delivery, but will keep you healthy as well!
1. Don’t smoke – or quit smoking as early in the pregnancy as you can.
2. Abstain from alcohol and drugs – there are no safe amounts!
3. Make and keep regular appointments with your provider.
4. Tell your provider if you are experiencing violence in the home.
5. Minimize stress during your pregnancy if you can.
6. Take a prenatal vitamin containing folic acid for healthy development.

3. Do I Need Prenatal Care?
Getting early, regular prenatal care is one of the most important things that you can do for you and your baby. Your provider can monitor the progress of your pregnancy, and help you to have safe and healthy delivery outcomes. Regular health care visits can reduce your risk of having your baby prematurely, which can have undesirable impacts on baby’s health and wellness right after birth and in the future. Call your provider as soon as you believe that you are pregnant and keep your appointments as your pregnancy progresses to help track your baby’s development and have the healthiest pregnancy possible.

Learn more by visiting March of Dimes’ Prenatal Care Checkups!
(Source: https://www.marchofdimes.org/pregnancy/prenatal-care-checkups.aspx)

4. Quit — It’s Worth It!
Tobacco use in pregnancy has been linked to premature births for babies, which can lead to underdeveloped lungs and brain functioning. Babies who are born prematurely can have difficulties feeding, breathing problems, and even trouble with their eyesight and hearing. Even babies who are born full-term can suffer the effects of low birth weight, and can have stunted development or defects due to tobacco use. Quitting smoking is one of the best things you can do for your baby – and yourself!

For more information on tobacco cessation programs available, contact your local health department or the Kansas Tobacco Quitline.
(Source: https://www.cdc.gov/tobacco/campaign/tips/diseases/pregnancy.html)

5. The Last Weeks Matter!
While the last few weeks of pregnancy can feel as though they last forever, they are essential to the health of your baby! In a normal, healthy pregnancy, waiting to deliver until you’re past the 39 week mark can help ensure that your baby’s brain and lungs are fully developed and can help avoid complications caused from premature delivery.
